## Welcome

We offer a variety of specialised services and recognise that every person referred in to our neurological centres is unique. Our response is tailored to the specific needs of each person, their family and their individual circumstances. We work closely with people to make sure that their personal goals are understood and supported whether this is for active neurological and physical rehabilitation, longer- term neurological support or care and support through a progressive condition to the end of a person's life if needed.

# Pathways

## Neurorehabilitation

**Our experienced teams assess and formulate the needs and wishes of each person we work with, starting with the pre-admission assessment visit.**

The clinical assessment forms the basis of an individual rehabilitation plan which is developed with the person, their family and supporters. This ensures that individualised rehabilitation goals are achievable, meaningful and relevant to each unique situation. We employ full clinical therapy teams who work closely to design and deliver integrated, transdisciplinary care and treatment that can be provided by more than one discipline.

## Complex Physical Care

**We support men and women who present with complex physical impairments relating to a neurological condition.**

We provide services for people who are diagnosed with a Prolonged Disorder of Consciousness (PDoC), those who may have a tracheostomy or require ventilation. The person's complex physical presentation may be as a result of a brain or spinal injury or neurological event such as a stroke. We also work with people who have Guillain-Barré syndrome and other neurological conditions.

People in our care may have a PEG or PEJ for nutrition or hydration and for giving medication, they may have a catheter in situ, or need to be supported using a hoist for transfers. Posture, seating, sleep support, mobility, nutrition, continence and spasticity issues are addressed in all services where we provide complex physical care.

# Pathways

## Neuroprogressive Conditions

**People with neuroprogressive conditions and their families require support from experienced practitioners who can provide responsive care and treatment as a person's condition changes over time.**

Whether this is in relation to memory or mood changes, mobility or positioning support, pain management or fatigue, variations in weight or dietary requirements or changes to the way a person behaves.

We support people through various phases of their condition, listening to the person and observing changes in presentation to ensure all aspects of the person's wellbeing are taken into account.

## Complex Dementias

**We support men and women who present with complex needs and behaviours including disinhibition, confusion, aggression and antisocial behaviour.**

We also support people who have associated physical care needs including PEG, catheterisation, mobility problems and those who require palliative care. People are encouraged to be as independent as possible and are able to explore our dementia friendly environments.

Activities are planned to stimulate memories, maintain maximum independence and encourage interaction within and outside of the centres.

## Neurobehavioural

**Our specialist hospital services provide neurobehavioural programmes for men and women who present with significant challenges.**

Individuals in these services may also be detained under the Mental Health Act 1983 (amended 2007). We aim to minimise risk and maximise opportunities for new learning, typically employing multicomponent interventions drawn from the latest developments in neurobehavioural rehabilitation.

The clinical team includes highly experienced neurobehavioural rehabilitation practitioners and trainers. Programmes are overseen by Clinical Psychologists and delivered by a range of neurobehavioural practitioners who are specialists in their field.
